

Target-Score-Calculator

A program that calculates the score a student needs on an upcoming assessment to achieve their desired final grade. It uses their current grade, grade weights, and target score to provide the required score.

Features

- using add, multiplication, division, subtraction
- program will add all (input) scores in respective groups before dividing the sum with the num. of inputs
- program will use target / test weight to multiply with the average
- program will add result to current grade (starting: 100, decreasing with each wrong answer / imperfect score)

How to Run the Program

1. Have Python installed in your computer
2. Download the file tagret_score_calculator.py
3. Open a terminal or command prompt
4. Run the program by pressing the 'run' button (usually found at the top menu bar)
5. Enter the required inputs (current grade, target grade, and exam weight)

Example Output

=== Target Score Calculator ===

Enter Current Grade: 85%

Enter Target Grade: 90%

Enter Exam Weight: 40%

Required Exam Score: 97.50%

You need 97.50% to reach your target grade.

Contributors

- Student 1: Francine Arnelyn L. Chua (input validation, user interface)
- Student 2: Wilaida Ami J. Mendoza (output and calculation)
- Student 3: Kirstie Isobel Bayno (steps on running the program)
